

Antigravity Test Automation Matrix: Samartha Ayurveda Platform

Feed this directly to your Antigravity testing agent as a structured prompt or .md plan file.

Phase 1: Redirection & Core Logic (Backend Agent)

**Objective:** Verify the IP tracking, redirection speed, and card status rules using API-level and network interception tests.

| Task ID | Module    | Agent Execution Instructions                                                                                                                                                                                                           | Expected Antigravity Artifact                              |
|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| TC-01   | Routing   | <p><b>Action:</b> Send a GET request to a known active card slug (/t/emp01).</p> <p><b>Assert:</b> Receive HTTP status 302 Found and the Location header matches the Samartha Ayurveda Ad URL.</p>                                     | Passing unit test log; Network response trace.             |
| TC-02   | Analytics | <p><b>Action:</b> Send two consecutive GET requests to the same card slug using identical mocked X-Forwarded-For IP headers.</p> <p><b>Assert:</b> Database Tap_Logs registers 2 entries, but the unique IP count query returns 1.</p> | SQL query execution log showing DB state before and after. |

|       |             |                                                                                                                                                                                                                                                                       |                                                 |
|-------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| TC-03 | Status Lock | <p><b>Action:</b> Execute a DB command to set <code>card_status</code> to 'Paused'. Send a GET request to the card's slug.</p> <p><b>Assert:</b> Receive HTTP status <code>302 Found</code>, but the <code>Location</code> header routes to the company homepage.</p> | Code diff of the test script; Passing test log. |
|-------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|

## Phase 2: Admin Panel & Gamification (Browser Automation Agent)

**Objective:** Instruct the agent to open a Chromium session, navigate the UI, and verify the administrative and gamification features.

| Task ID | Module | Agent Execution Instructions                                                                                                                                                                                                                  | Expected Antigravity Artifact                                                                        |
|---------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| TC-04   | Auth   | <p><b>Action:</b> Launch browser, navigate to <code>/admin/login</code>, input valid credentials, and click "Login".</p> <p><b>Assert:</b> Successful redirect to the Admin Dashboard; session cookie is present.</p>                         | <p><b>Browser Recording</b> of the login flow;</p> <p><b>Screenshot</b> of the loaded dashboard.</p> |
| TC-05   | Quests | <p><b>Action:</b> Navigate to the "Daily Goals" tab. Create a new goal: Target = 20 Scans, Reward = "Coffee Voucher". Save the form.</p> <p><b>Assert:</b> The new goal appears in the active list table and database persists the entry.</p> | <b>Screenshot</b> of the UI before and after form submission.                                        |

|              |             |                                                                                                                                                                                                                                                  |                                                                |
|--------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>TC-06</b> | Export      | <p><b>Action:</b> Click the "Export to Excel" button in the Analytics tab.</p> <p><b>Assert:</b> Intercept the download event and verify the MIME type is <a href="#">application/vnd.openxmlformats-officedocument.spreadsheetml.sheet</a>.</p> | Download interception log.                                     |
| <b>TC-07</b> | Kill Switch | <p><b>Action:</b> Navigate to "Card Management", find a test employee's active card, and toggle the status to "Terminated".</p> <p><b>Assert:</b> The UI state updates instantly without page reload (verify via DOM assertion).</p>             | <b>Browser Recording</b> of the toggle action and UI response. |

### Phase 3: Employee Panel (Browser Automation Agent)

**Objective:** Verify that the read-only dashboard correctly displays the digital ID and live gamification updates.

| Task ID      | Module     | Agent Execution Instructions                                                        | Expected Antigravity Artifact                    |
|--------------|------------|-------------------------------------------------------------------------------------|--------------------------------------------------|
| <b>TC-08</b> | Digital ID | <p><b>Action:</b> Log in as a standard Employee. Navigate to the "Profile" tab.</p> | <b>Screenshot</b> of the fully rendered ID card. |

|              |            |                                                                                                                                                                                                                                        |                                                                                |
|--------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
|              |            | <b>Assert:</b> DOM elements for Employee ID, Name, Phone, and Photo URL match the mocked database seeding data.                                                                                                                        |                                                                                |
| <b>TC-09</b> | Live Goals | <b>Action:</b> View the progress bar on the dashboard. Trigger a backend tap event (via API call) for this employee.<br><br><b>Assert:</b> Refresh the page and assert the progress bar DOM element updates (e.g., from 0/20 to 1/20). | <b>Browser Recording</b> showing the dashboard updating after a simulated tap. |
| <b>TC-10</b> | Inbox      | <b>Action:</b> Navigate to the "Notifications" tab.<br><br><b>Assert:</b> The global notice sent by the Admin in Phase 2 is visible and marked as "Unread".                                                                            | DOM snapshot and passing test log.                                             |

## How to orchestrate this in Antigravity

To execute this efficiently without bottlenecking your environment:

1. **Spawn Parallel Agents:** In your Agent Manager, dispatch one agent to handle **Phase 1** (Backend/API testing using Jest/PyTest) and simultaneously dispatch a second agent to handle **Phase 2 & 3** (UI testing using Playwright).
2. **Set Autonomy Levels:** For these test generation tasks, set the agent configuration to **"Turbo"** for terminal commands so it can auto-install any necessary testing dependencies (like `playwright install`), but leave the review policy on **"Agent Decides"** so you can review the architecture of the E2E scripts before they run against your mock database.
3. **Review the Verification Tab:** Once the agents complete the runs, you won't need to manually verify the UI. You can simply review the generated screenshots and browser

recordings within Antigravity's artifact viewer to confirm the Gamification and Employee ID panels look exactly as intended.
